

[CONTAINER FOR STORING MULTIPLE SAW BLADES]

Abstract

A container for storing and transporting multiple circular saw blades. This invention provides for a circular, portable, carrying case to safely and conveniently store and transport circular saw blades. The invention has several circular trays and each tray had an insert that houses and securely segregates the circular saw blades. The tray and insert feature protects the user from being injured by the saw blades and ensures that the blades do not become dull due to their moving around in the around in the storage container. The invention provides that each circular tray rotates and swings open to allow the user easy access to the saw blades contained inside the storage container. There is a pin that extends through each tray and the pin provides a means for the pivoting action, rotating and swinging action of each circular tray. Each tray has a latching mechanism that secures the tray in place so that the tray does not inadvertently swing open. A carrying handle is located on top of the storage container, and it provides a method by which the invention can be transported by the user.
